Publication of record for individual papers is online in the SPIE Digital Library.

Paper Numbering: Proceedings of SPIE follow an e-First publication model, with papers published first online and then in print and on CD-ROM. Papers are published as they are submitted and meet publication criteria. A unique, consistent, permanent citation identifier (CID) number is assigned to each article at the time of the first publication. Utilization of CIDs allows articles to be fully citable as soon as they are published online, and connects the same identifier to all online, print, and electronic versions of the publication. SPIE uses a six-digit CID article numbering system in which:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc.

The CID Number appears on each page of the manuscript. The complete citation is used on the first page, and an abbreviated version on subsequent pages. Numbers in the index correspond to the last two digits of the six-digit CID Number.

Introduction

Czech, Slovak and Polish optical scientists met for the first time in 1972 at Rusava and established a long lasting tradition of optical meetings this way. Forty years later, in 2012, they met again for the eighteenth time during the 18th Czech-Polish-Slovak Optical Conference held in Sepetná in the Beskydy Mountains from September 3–7. The conference was organized by the Joint Laboratory of Optics of Palacký University and Institute of Physics of Academy of Sciences of the Czech Republic, together with the Regional Center of Advanced Technologies and Materials of Palacký University, and provided the space for informing about new achievements and obtained experience, discussing new ideas, as well as meeting colleagues together. More than 140 participants heard interesting talks covering classical as well as nonlinear and quantum optics. Thirteen invited talks were devoted to optical manipulations with particles (P. Zemánek), femtosecond frequency combs (O. Číp), digital holographic microscopy (R. Chmelík), holographic recording (D. Senderáková), optical filtering for optical networks (J. Müllerová), design of advanced photonic structures (I. Richter), ferromagnetic thin films (J. Pištora), fiber lasers (P. Honzátko), photonic-crystal fibers (W. Urbańczyk), pulse propagation in microstructured fibers (I. Bugár), quantumness and entanglement in optical fields (A. Miranowicz), nonlinear quantum-state engineering (W. Leoński), and optics in cosmic-rays research (M. Hrabovský). They were accompanied by 57 contributed talks and more than 50 posters.

Interesting material contained both in talks and posters has been summarized in the contributions included in these proceedings. They are divided into six groups covering classical optics, manipulations with particles, particle trapping and microscopy, fibers, lasers, photonic structures, and quantum and nonlinear optics. In these contributions the reader can find the newest information about the development in the field.

We would like to express our gratitude to members of the International Scientific Committee, members of the Local Organizing Committee, session chairs as well as all the participants who contributed to the success of the conference.
